INVESTOR PITCH · SCRIPT BY SPEAKER

loop. who says what

Everyone speaks once. Beatriz opens, presents the money and closes; each teammate presents the part they own. Total ≈ 4:15. Hand over by name, walk to the front as the previous speaker finishes, and never read from the slide.

ORDER	SPEAKER	SLIDES	TIME

9	**Beatriz**	Financials, the ask, vision	**3:30–4:15**

Beatriz

0:00–0:10

SLIDE 0 · TITLE

"Hi, we're loop. We turn the time students already spend scrolling into time spent studying their own courses."

Beatriz

0:10–0:45

SLIDE 1 · PROBLEM

Your real story here. Example: "Last semester I left Statistics until the week before the exam. Everything had made sense in class, but I'd forgotten most of it, so I spent nights rewatching slides and random YouTube videos that didn't match what our professor taught.

Every student here knows this cycle. Concepts click in class, reviewing feels like a whole separate study session, so we postpone it, forget, and cram. It isn't laziness: our course material isn't built for quick, frequent revision."

→ **"Ferdinand will show you what we built."**

Ferdinand

0:45–1:05

SLIDE 2 · SOLUTION

"loop. turns the material you already have, your professor's slides, readings and assigned videos, into a five-minute, TikTok-style feed. Swipe to learn: one concept in under a minute, with the slide it came from. Swipe to test: every two cards, a quick question about that content. Swipe to reinforce: what you miss comes back before the exam."

→ **"Noor, show them."**

Noor

1:05–1:25

SLIDE 2 · LIVE DEMO

Phone mirrored to the screen, on studywithloop.github.io/app/: “Here’s a concept card… now a quick check: I’ll answer it wrong on purpose… and at the end, loop. brings it back: swipe to reinforce.”

> Keep it to 20 seconds. If the phone fails, Ferdinand hands over the backup phone immediately.

→ **“Dalya, did people actually use it?”**

Dalya

1:25–1:50

SLIDE 3 · TRACTION

“In two weeks we went from an idea to a landing page and a live MVP. 15 students signed up organically, without a euro on ads. 7 classmates tested the MVP and rated it 3 out of 5. For a first version that’s our starting point, not our result: they told us exactly what to fix, **[top piece of feedback]**, and our pilot target is 4 out of 5.”

→ **“Beatriz will explain how we make money.”**

Beatriz

1:50–2:15

SLIDE 4 · BUSINESS MODEL

“The daily feed is free, so students build the habit. Exam mode, spaced review timed to the exam, is €4.99 a month. Like most study apps, students alone rarely pay back what it costs to win them, so the free app is our channel and faculties are the business. A faculty licence is €10 per student per year, about €14,500 a faculty, just under the limit where Spanish public universities need a tender. It earns about €35,000 over three years against roughly €10,000 to win it: 3.5 to 1.”

→ **“Ghaya will tell you how we reach students.”**

Ghaya

2:15–2:40

SLIDE 5 · GO-TO-MARKET

“We grow one class at a time. Our first 100 users are our own classes: class WhatsApp groups and QR stickers where students wait. Then Instagram and student ambassadors, then professor pilots, which lead to faculty licences, starting with private universities in Madrid. And every feed ends with ‘send to my class’, so one user can bring a whole class.”

→ **“Bianca, how big can this get?”**

Bianca

2:40–3:10

SLIDE 6 · MARKET & COMPETITION

“We start with our own classes, then IE’s more than 10,000 students, then 1.88 million university students in Spain and 19.1 million tertiary students in the EU. At €10 per student, that’s a ceiling of about €190 million a year in Europe. Our year-3 goal is concrete: 30 paying faculties. Students already use ChatGPT and NotebookLM, but they need prompts and don’t know your course. Quizlet and Anki test you but don’t explain. TikTok and YouTube explain, but not your syllabus. loop. is your own course, five minutes a day, with active recall built in.”

→ **“Marcelo will introduce the team.”**

Marcelo
3:10–3:30
SLIDE 7 · TEAM

"Why us? We are the users. Seven students who live this problem every exam season, with no duplicated roles: Beatriz runs finance and the business model, Noor and Ferdinand build the AI, Bianca owns the market and professor partnerships, I run sales and operations, Dalya leads user research and Ghaya leads growth. The person we're still missing is **[e.g. a learning scientist]**."

> Each person gives a small nod or wave when named.

→ **"Beatriz, the numbers."**

Beatriz
3:30–3:50
SLIDE 8 · FINANCIALS

"We project €25k in year one, €131k in year two and about €400k in year three. Year one is small on purpose: university sales take six to eighteen months. By year three: 120,000 students, 4,800 paying, and 30 faculty licences bringing about 80% of revenue. We break even at around 60 faculties, in year four or five."

Beatriz
3:50–4:05
SLIDE 9 · THE ASK

"We're raising €400k for 18 months. In six months: the AI video clipper and slide generator, and three professor pilots. By month twelve: 10,000 students and our first three paying faculties. By month eighteen: about eight faculties and €11k in monthly revenue, ready for a seed round. We'll add non-dilutive funding from ENISA and CDTI Neotec."

Beatriz
4:05–4:15
SLIDE 10 · VISION

"Our vision: every university course, revised in five minutes a day. Nobody should have to relearn a semester in a week. Cool kids stay in the loop. Thank you."

> Stop here. Everyone stays at the front for questions.

Q&A · WHO ANSWERS WHAT

likely questions

“Why wouldn’t students just use ChatGPT or NotebookLM?” · Beatriz
They need a prompt and a sit-down session, and they don’t know the course. loop. already has the course, starts in one tap, and builds in active recall and spaced review up to the exam date.

“How do you make sure the AI content is accurate?” · Ferdinand
Cards only use the uploaded material, every card links to its exact slide or video timestamp, and professors can approve a feed before students see it.

“How does the video clipping work?” · Noor
We take the video’s transcript, find where the topic changes, cut 45–120-second clips there, and write one question for every two clips from that part of the transcript only.

“Will students come back after the novelty wears off?” · Dalya
That’s our biggest risk and what we’re testing now: week-2 return rate in the pilot, plus a 48-hour recall experiment against normal notes.

“How big is the market, and who are your competitors?” · Bianca
Built bottom-up: our classes, IE, 1.88M students in Spain (Ministry, 2025–26), 19.1M in the EU (Eurostat). Competitors prove the demand; none of them is course-aware with recall built in.

“Who pays, and how do you sell to universities?” · Marcelo
Students pay for exam mode; faculties buy a one-year licence after a free pilot term, at €10 per student (about €14.5k, under the €15k limit for buying without a tender). Private universities first.

“Do students pay back what it costs to get them? Why is year one so small?” · Beatriz
Not on their own: study apps convert about 2–4% of users and keep a payer about a year, so a student’s value (≈ €16) is below its cost (≈ €50). That’s why faculties are the business, at 3.5 to 1. Year one is small because university sales take 6–18 months; benchmarks are in our numbers check.

“How will you get your first users?” · Ghaya
Our own classes first: class groups, QR stickers, Instagram and ambassadors. Our first 15 sign-ups were all organic.

“What will you do with the money? What about rights and privacy?” · Beatriz
€400k for 18 months, tied to three milestones. We only use material with the professor’s permission, link videos rather than re-hosting them, and collect the minimum student data under GDPR.
